

## **New ORS Version 3.0**

### **The most important new features**

#### **Updating Standing Data**

Errors in the asset standing data can be corrected in MIG21 with the use of an individually-defined validity period. In this way the checking can be run with correct data without having to wait for the correction from the back office.

#### **Optimised Data Management**

ORS now has a relational data model means that external systems (e.g. reporting tools) have access to the data during day-to-day business. In addition the start times of the ORS server components are visibly reduced.

#### **Increased Availability**

Load times are shorter and the availability of the system is markedly increased as a result of the fund-by-fund data import.

#### **Polling during Import**

Polling during import allows the supply of data to ORS without any delay because the import triggers either a data file to be stored onto a local drive (ORSService) or the update of the data itself.

#### **Further features:**

- Multi company capability
- Fund-related synchronisation of MIG21/ORS
- Enhancement of the transaction history
- Optimised order import (incl. BVI Standards)
